Agenda

- LDP Overview
- LDP Protocol Details
- LDP Configuration and Monitoring

Label Distribution Protocol

Overview

- MPLS nodes need to exchange label information with each other
 - Ingress PE node (Push operation)
 - Needs to know what label to use for a given FEC to send packet to neighbor
 - Core P node (Swap operation)
 - Needs to know what label to use for swap operation for incoming labeled packets
 - Egress PE node (Pop operation)
 - Needs to tell upstream neighbor what label to use for specific FEC type LDP used for exchange of label (mapping) information
- Label Distribution Protocol (LDP)
 - Defined in RFC 3035 and RFC3036; updated by RFC5036
 - LDP is a superset of the Cisco-specific Tag Distribution Protocol
- Note that, in addition LDP, also other protocols are being used for label information exchange
 - Will be discussed later

Label Distribution Protocol

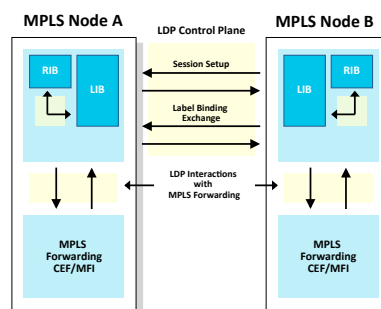

Some More Details

- Assigns, distributes, and installs (in forwarding) labels for prefixes advertised by unicast routing protocols
 - OSPF, IS-IS, EIGRP, etc.
- Also used for Pseudowire/PW (VC) signaling
 - Used for L2VPN control plane signaling
- Uses UDP (port 646) for session discovery and TCP (port 646) for exchange of LDP messages
- LDP operations
 - LDP Peer Discovery
 - LDP Session Establishment
 - MPLS Label Allocation, Distribution, and Updating MPLS forwarding
- Information repositories used by LDP
 - LIB: Label Information Database (read/write)
 - RIB: Routing Information Database/routing table (read-only)

Label Distribution Protocol

Operations Details

- LDP startup
 - Local labels assigned to RIB prefixes and stored in LIB
 - Peer discovery and session setup
 - Exchange of MPLS label bindings
- Programming of MPLS forwarding
 - Based on LIB info
 - CEF/MFI updates

Agenda LDP Protocol Details

- LDP Concepts
- LDP Identifier
- LDP PDU
- LDP Messages
- LDP Session Establishment
- LDP Sessions between ATM LSRs
- Targeted LDP sessions
- Summary

LDP Concepts

- Label Distribution Protocol
 - LDP works between adjacent/non-adjacent peers
 - LDP sessions are established between peers
 - LDP messages sent in the form of TLVs
<Type, Length, Value>
- Standardized via RFC 3036 (Updated by RFC 5036)

bdNOG2 in Cox's Bazar, Bangladesh. © 2014 Cisco and/or its affiliates. All rights reserved.

Cisco Public

TDP/LDP Transport

- Uses TCP for reliable transport
- Well-known TCP port
 - *LDP (port 646)*
 - *TDP (port 711)*
- LSR with higher LDP router-id opens a connection to port 646 of other LSR
- Design Choice:
 - *One TDP/LDP session per TCP connection*

bdNOG2 in Cox's Bazar, Bangladesh. © 2014 Cisco and/or its affiliates. All rights reserved.

Cisco Public

LDP Identifier

- Identifies tag space
- 6 bytes (4 bytes => IP address, 2 bytes => Label space ID)

bdNOG2 in Cox's Bazar, Bangladesh. © 2014 Cisco and/or its affiliates. All rights reserved.

Cisco Public

LDP Identifier: Label Space

- LSRs establish one LDP session per label space.
 - Per-platform label space requires only one LDP session, even if there are multiple parallel links between a pair of LSRs.
- Per-platform label space is announced by setting the label space ID to 0, for example:
 - LDP ID = 1.0.0.1:0
- A combination of frame-mode and cell-mode MPLS, or multiple cell-mode links, results in multiple LDP sessions.

bdNOG2 in Cox's Bazar, Bangladesh. © 2014 Cisco and/or its affiliates. All rights reserved.

Cisco Public

Label Space and number of LDP sessions (Cont.)

–One LDP session is established for each announced LDP identifier (router ID + label space).

–The number of LDP sessions is determined by the number of different label spaces.

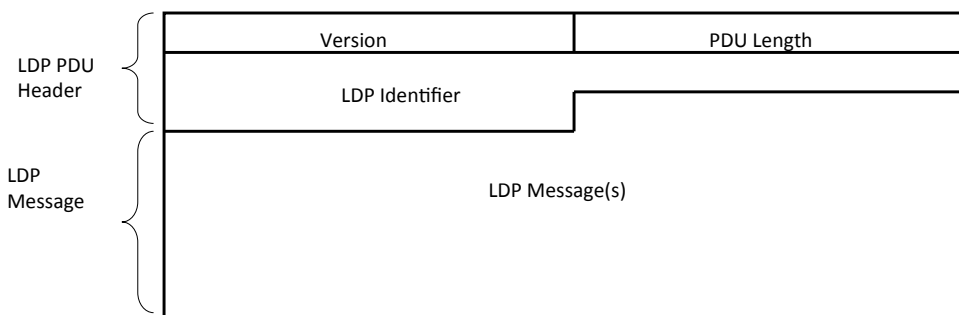

–The bottom right example is not common, because ATM LSRs do not use Ethernet for packet forwarding, and frame-mode MPLS across ATM uses per-platform label space.

Cisco Public

LDP Protocol Data Units

- All LDP information is sent in the form of PDUs over the TCP connection

Version => LDP version. Current LDP version is 1

PDU Length (excludes Version and PDU Length fields) => total length of PDU in bytes.

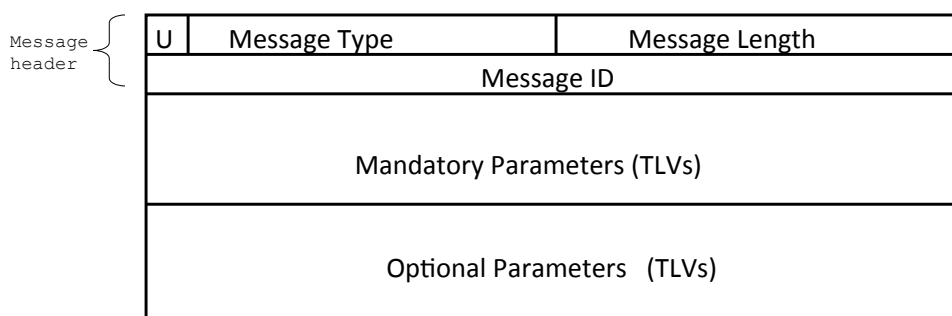

LDP Identifier => discussed earlier

LDP Messages => one or more LDP messages

bdNOG2 in Cox's Bazar, Bangladesh. © 2014 Cisco and/or its affiliates. All rights reserved.

Cisco Public

LDP Message

U bit is the Unknown Message bit. If the received message is of unknown type, then if:

U=0, send Notification Message to the originator of this message

U=1, silently ignore the unknown message

bdNOG2 in Cox's Bazar, Bangladesh. © 2014 Cisco and/or its affiliates. All rights reserved.

Cisco Public

LDP Message TLVs

U bit is the Unknown TLV bit. If the received TLV is of unknown type, then if:
 U=0, send Notification Message to the originator of this message and ignore the entire message
 U=1, silently ignore the unknown TLV and process the rest of the message

F bit is the Forward unknown TLV bit. F bit is only applicable when the U=1
 F=0, the unknown TLV is not forwarded with its LDP message
 F=1, the unknown TLV is forwarded with its LDP message

bdNOG2 in Cox's Bazar, Bangladesh. © 2014 Cisco and/or its affiliates. All rights reserved.

Cisco Public

LDP Messages Types

DISCOVERY messages

ADJACENCY messages deal with initialization, keepalive & shutdown of sessions

LABEL ADVERTISEMENT messages deal with label binding, requests, withdrawal & release

NOTIFICATION messages provide advisory information & signal errors

bdNOG2 in Cox's Bazar, Bangladesh. © 2014 Cisco and/or its affiliates. All rights reserved.

Cisco Public

Discovery Message

- Used to discover and maintain the presence of new peers using HELLO messages
- Hello packets (UDP) sent to all-routers multicast address (224.0.0.2)
- Direct unicast hello is sent to non-adjacent neighbors
- Once session is established, HELLO messages serve as link integrity messages
- Session is bi-directional

bdNOG2 in Cox's Bazar, Bangladesh. © 2014 Cisco and/or its affiliates. All rights reserved.

Cisco Public

Adjacency Messages

INITIALIZATION

Two LSRs negotiate on various parameters & options

These include keepalive timer values, Label ranges, Unsolicited vs. On-demand label advertisement, Ordered vs. Independent mode, Liberal vs. Conservative Label retention

KEEPALIVE

LDP message that indicates that neighbor is alive

bdNOG2 in Cox's Bazar, Bangladesh. © 2014 Cisco and/or its affiliates. All rights reserved.

Cisco Public

Label Advertisement related messages

- **LABEL RELEASE**

An LSR releases a Label Binding that it previously got from its LDP peer. Used in Conservative Label Retention mode

- **LABEL REQUEST**

Used by an upstream LSR to request a Label binding for a prefix from the downstream LDP peer. Used in downstream on-demand mode

- **LABEL ABORT REQUEST**

Send to abort the LABEL REQUEST message

- **LABEL MAPPING**

Are the TLV object containing <Label, prefix> information

- **LABEL WITHDRAWAL**

Used to revoke a previously advertised label binding

bdNOG2 in Cox's Bazar, Bangladesh. © 2014 Cisco and/or its affiliates. All rights reserved.

Cisco Public

Notification message

- **NOTIFICATION**

Used for Error Notification and Advisory

bdNOG2 in Cox's Bazar, Bangladesh. © 2014 Cisco and/or its affiliates. All rights reserved.

Cisco Public

LDP Session Establishment

- LDP establishes a session by performing the following:
Hello messages are periodically sent on all interfaces that are enabled for MPLS.
If there is another router connected to that interface, that it also has MPLS enabled, it will respond by trying to establish a session with the source of the hello messages.
- UDP is used for hello messages. It is targeted at “all routers on this subnet” multicast address (224.0.0.2).
- TCP is used to establish the session.
- Both TCP and UDP use well-known LDP port number 646 (711 for TDP).

bdNOG2 in Cox's Bazar, Bangladesh. © 2014 Cisco and/or its affiliates. All rights reserved.

Cisco Public

LDP Hello Message

- Hello messages are targeted at all routers reachable through an interface.
- LDP uses well-known (UDP and TCP) port number 646.
- The source address used for an LDP session can be set by adding the transport address TLV to the hello message.
- A 6-byte LDP identifier (TLV) identifies the router (first four bytes) and label space (last two bytes).

Cisco Public

LDP Session: Transport Connection

- Once LDP peers receive hellos, they establish a TCP connection
- Peer with higher LDP router-id is active LSR and the peer with lower LDP router-id is the passive LSR
- Active LSR tries to open a TCP connection to the well-known LDP port number 646 of the passive LSR, while the passive LSR waits for the active LSR to initiate the connection

bdNOG2 in Cox's Bazar, Bangladesh. © 2014 Cisco and/or its affiliates. All rights reserved.

Cisco Public

LDP Session: Session Initialization

- Active LDP peer (1.0.0.2) sends Initialization message to passive LDP peer
- Initialization message contains important parameters:
 - Session keepalive time (default=180 sec)
 - Label distribution method: Downstream unsolicited
 - Max PDU length
 - Receiver's LDP Identifier
 - Whether Loop Detection is enabled
 - Some optional parameters

bdNOG2 in Cox's Bazar, Bangladesh. © 2014 Cisco and/or its affiliates. All rights reserved.

Cisco Public

LDP Session: Session Initialization (cont.)

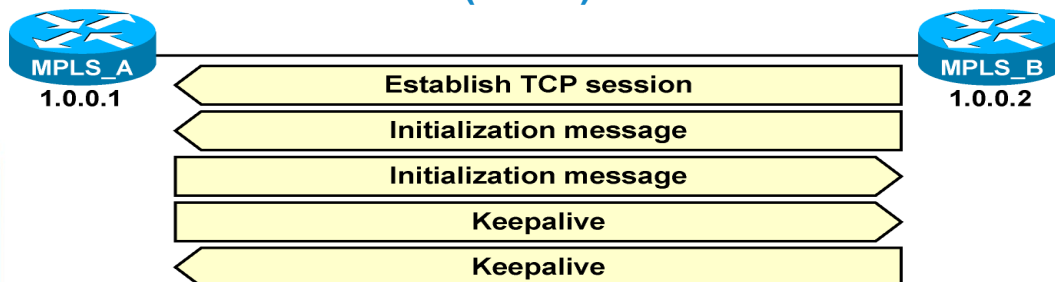

- Passive LDP peer sends Initialization message and/or keepalive message to active LDP peer if Initialization message parameters are acceptable
- Passive LDP peer could also send Error Notification & close the LDP connection if something was unacceptable

bdNOG2 in Cox's Bazar, Bangladesh. © 2014 Cisco and/or its affiliates. All rights reserved.

Cisco Public

LDP Session: Session Initialization (cont.)

- Active LDP peer sends keepalive to passive LDP peer & the LDP session is up
- The session is ready to exchange label mappings after receiving the first keepalive.

bdNOG2 in Cox's Bazar, Bangladesh. © 2014 Cisco and/or its affiliates. All rights reserved.

Cisco Public

LDP Sessions Between ATM LSRs

–An IP adjacency between ATM LSRs is established through the control virtual circuit (0/32).

–The control virtual circuit is used for LDP as well as for IP routing protocols.

–VSI protocol is used to populate the ATM switching matrix (LFIB) in the data plane of some ATM switches (Cisco implementation).

bdNOG2 in Cox's Bazar, Bangladesh. © 2014 Cisco and/or its affiliates. All rights reserved.

Cisco Public

Targeted LDP Sessions

–LDP neighbor discovery of nonadjacent neighbors differs from normal discovery only in the addressing of hello packets:

Hello packets use unicast IP addresses instead of multicast addresses.

–When a neighbor is discovered, the mechanism to establish a session is the same.

bdNOG2 in Cox's Bazar, Bangladesh. © 2014 Cisco and/or its affiliates. All rights reserved.

Cisco Public

Summary

- TCP is used to establish LDP sessions between neighbors.
- LDP uses PDUs to carry messages
- LDP hello messages contain an identifier field that uniquely identifies the neighbor and the label space.
- Per-platform label space requires only one LDP session.
- Routers that have the higher IP address must initiate the TCP session.
- LDP session negotiation is a three-step process.
- LDP sessions between ATM LSRs use the control VPI/VCI, which by default is 0/32.
- Nonadjacent neighbor discovery is accomplished by using unicast IP addresses instead of multicast.

Agenda LDP Configuration and Monitoring

- **Configuration**
- Verifying Your Configuration
- Monitoring LDP

bdNOG2 in Cox's Bazar, Bangladesh. © 2014 Cisco and/or its affiliates. All rights reserved.

Cisco Public

Configuring MPLS

- **Mandatory**
 - Enable CEF switching if this is not the platform default
 - Configure TDP or LDP on every label-enabled interface
 - TDP not supported on IOS XR
- **Optional**
 - Configure MTU size for labeled packets
 - Configure IP TTL propagation
 - Configure conditional label advertising

bdNOG2 in Cox's Bazar, Bangladesh. © 2014 Cisco and/or its affiliates. All rights reserved.

Configuring LDP (IOS)

Global

```
ip cef <distributed>
mpls label protocol <ldp | tdp | both>
tag-switching tdp router-id Loopback0
mpls ldp explicit-null (optional)
no mpls ip propagate-ttl (optional)
```

Interface

```
mpls ip or tag-switching ip (enables this interface for MPLS forwarding)
mpls label protocol ldp
```

(optional, if you want to run LDP on this interface only, while other interfaces don't run LDP or run another label protocol such as TDP)

bdNOG2 in Cox's Bazar, Bangladesh. © 2014 Cisco and/or its affiliates. All rights reserved.
Cisco Public

Configuring LDP (IOS XR)

```
mpls ldp
  router-id 1.1.1.1
  explicit-null (optional)
  log
  neighbor
  !
interface GigabitEthernet0/4/1/3
  !
  !
mpls ip-ttl-propagate disable (optional)
mpls oam
!
```

Cisco Public

Configuring Conditional Label Distribution (IOS)

```
tag-switching advertise-tags for net-acl [ to tdp-acl ]
```

- By default, labels for all destinations are announced to all LDP/TDP neighbors.
- This command enables you to selectively advertise some labels to some LDP/TDP neighbors.
- Conditional label advertisement only works over frame-mode interfaces.
- Parameters:
 - Net-ACL – the IP ACL that selects the destinations for which the labels will be generated.
 - TDP-ACL – the IP ACL that selects the TDP neighbors that will receive the labels.

bdNOG2 in Cox's Bazar, Bangladesh. © 2014 Cisco and/or its affiliates. All rights reserved.

Cisco Public

Configuring Conditional Label Distribution (IOS XR)

```
label advertise [ disable | for prefix-acl [ to peer-acl ] |  
interface type interface-path-id ]
```

- By default, labels for all destinations are announced to all LDP neighbors.
- This command enables you to selectively advertise some labels to some LDP neighbors.
- Conditional label advertisement only works over frame-mode interfaces.
- Parameters:
 - PREFIX-ACL – the IP ACL that selects the prefixes for which the labels will be generated.
 - PEER-ACL – the IP ACL that selects the LDP neighbors that will receive the labels.

bdNOG2 in Cox's Bazar, Bangladesh. © 2014 Cisco and/or its affiliates. All rights reserved.

Cisco Public

Conditional Label Distribution Example

- The customer is already running IP infrastructure.
- MPLS is only needed to support MPLS/VPN services.
 - Labels should only be generated for loopback interfaces (BGP next-hops) of all routers.
 - All loopback interfaces are in one contiguous address block (192.168.254.0/24).

bdNOG2 in Cox's Bazar, Bangladesh. © 2014 Cisco and/or its affiliates. All rights reserved.

Cisco Public

Conditional Label Distribution Router Configuration (IOS)

- Enable conditional label advertisement

```
no tag-switching advertise-tags
!
! Configure conditional advertisements
!
tag-switching advertise-tags for 90 to 91
!
access-list 90 permit ip 192.168.254.0 0.0.0.255
access-list 91 permit ip any
```

bdNOG2 in Cox's Bazar, Bangladesh. © 2014 Cisco and/or its affiliates. All rights reserved.

Cisco Public

Conditional Label Distribution Router Configuration (IOS XR)

- Enable conditional label advertisement

```
ipv4 access-list pfx_acl_1
 10 permit ipv4 host 31.0.0.0 any
!
ipv4 access-list peer_acl_1
 10 permit ipv4 host 9.9.9.9 any
!
mpls ldp
 label
  advertise
  disable
  for pfx_acl_1 to peer_acl_1
  !
  !
  !
```

Monitoring LDP: LDP parameters

```
mpls-7200a#sh mpls ldp parameters
Protocol version: 1
Downstream label generic region: min label: 16; max label: 100000
Session hold time: 180 sec; keep alive interval: 60 sec
Discovery hello: holdtime: 15 sec; interval: 5 sec
Discovery targeted hello: holdtime: 180 sec; interval: 5 sec
Downstream on Demand max hop count: 255
TDP for targeted sessions
LDP initial/maximum backoff: 15/120 sec
LDP loop detection: off
```

Forwarding traffic down the LSP

```
mpls-7200a#sh mpls forwarding-table 12.12.12.12
```

Local tag	Outgoing tag or VC	Prefix or Tunnel Id	Bytes tag switched	Outgoing interface	Next Hop
21	19	12.12.12.12/32	0	Et3/0	10.0.3.5

Note: Bytes tag switched this will increment if packets are being tag switched using this entry

```
mpls-12008a#sh mpls forwarding-table label 19
```

Local tag	Outgoing tag or VC	Prefix or Tunnel Id	Bytes tag switched	Outgoing interface	Next Hop
19	19	12.12.12.12/32	498	Et2/0	10.0.4.11
	19	12.12.12.12/32	1176	Et3/0	10.0.5.11

```
mpls-12008b#sh mpls forwarding-table labels 19
```

Local tag	Outgoing tag or VC	Prefix or Tunnel Id	Bytes tag switched	Outgoing interface	Next Hop
19	Pop tag	12.12.12.12/32	4176	Et1/0	10.0.17.12
